

## ⚡ Accelerate Test Execution with Adaptive Test and Ultra Edge

**Reference: RA\_451**

Welcome to the Adaptive Test DAS Demo — a powerful illustration of how test programs can be made smarter, more flexible, and responsive to real-time conditions using UltraEdge technology.

## Unlock Smarter Testing with DAS and UltraEdge

Welcome to the Adaptive Test DAS Demo — a powerful illustration of how test programs can be made smarter, more flexible, and responsive to real-time conditions. Whether you're running it locally or envisioning a scaled deployment on remote servers, this demo is built to showcase adaptability. As well during this demo we will use the UltraEdge computer in order to demonstrate how the powerfull computer can host your secured algorithm and interact with your test program without any modification of your test program.

## What This Demo Demonstrates

**Improving Test Efficiency** with Archimedes In this scenario, we will address several challenges and demonstrate how Archimedes solutions can help resolve them. The system uses an algorithm that analyses current results to make decisions in real time:

1. **Test Time Reduction:** If a test consistently achieves a certain yield threshold (e.g., 80%), the system will automatically disable that test to save time.
2. **Online Analysis:** When a test fails too frequently, a diagnostic flow will be automatically triggered to help identify and analyse the root cause.
3. **Quality Improvement:** Based on ongoing test results, the system will adapt test limits to better match the characteristics of the devices under test.

## Which algorithm

### Scenario Implementation

1. On the **left**, we see the structure of the test program: A simple sequence with three main tests—**Test1**, **Test2**, and **Test3**—and a sub-flow (disabled by default) that includes **Test F1**, which uses test limits for characterisation analysis.
2. On the **right**, we detail the logic that implements the scenario described in the previous slide:
3. **Test Time Reduction:** If **Test2** reaches a yield of **80% or more**, it will be **automatically disabled** to optimise test time.
4. **Online Analysis:** If **Test3**'s yield drops **below 40%**, the system **will activate the sub-flow** and execute **Test F1** for further characterisation.
5. **Quality Improvement:** If **Test F1** is active and its yield remains **below 90%**, the system will **automatically reduce the high limit** of the test by **5%**, continuing until the yield improves.

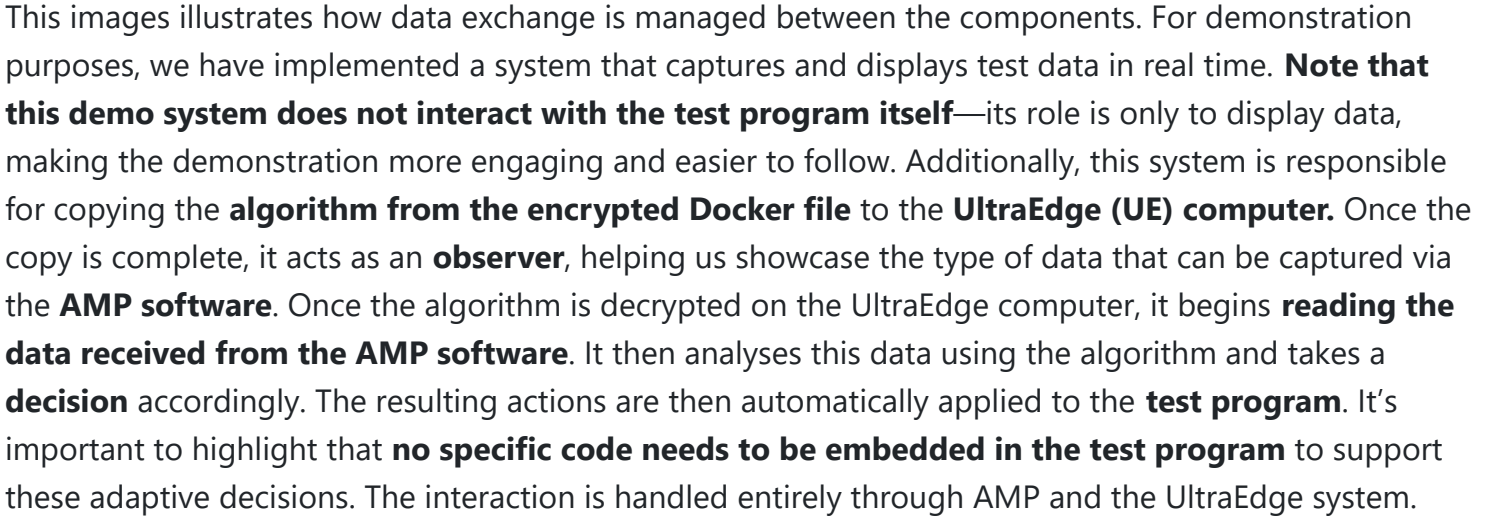

## Overall Infrastructure

## The overall infrastructure

This image illustrates the infrastructure used to deploy and protect the algorithm implementation described earlier. The Python-based scenario is packaged inside an **encrypted Docker file**. This file is initially stored on the **tester host**, then securely **uploaded to the UltraEdge computer**. Once it reaches the UltraEdge system, the Docker is **decrypted locally** and executed. This secure mechanism ensures that your **intellectual property is fully protected**. Even if you are testing your product in a third-party Test House, your algorithm—potentially containing sensitive logic or proprietary data—remains secure and inaccessible from outside. Importantly, **the test program itself remains unchanged**. Thanks to AMP, it is possible to interact with it directly and securely, without modifying the original test flow.

## Data Exchange

## Explore the Demo Software

The demo application includes four dedicated sections:

### DAS Section

View all messages generated by the tester. Clicking on a message reveals its detailed contents.

UltraEdge Section

Into this tab you will be allowed to upload the docker file into the **UltraEdge System**

## Flow Section

Into this section the system will show you which test has been executed and as well if a test has been disabled through an Adaptive Command.

## Test Results Display Section

Displays the test results for **Test F1** and its associated limits.

## Technical Snapshot

| Component | Version |
|-----------|---------|
| Language  | C#      |
| Framework | .NET 8  |

| Component   | Version       |
|-------------|---------------|
| Environment | Windows 10    |
| Excel       | 2016 (64-bit) |
| IGXL        | 10.60.02      |

---

## Extend the Demo to Your Environment

To implement a similar system, we recommend reviewing the following guides:

| Reference Architecture | Description                               |
|------------------------|-------------------------------------------|
| <a href="#">RA 468</a> | How to implement a DAS in C#              |
| <a href="#">RA 465</a> | How to send an adaptive command in Python |

---

## See It in Action

Explore the complete [Instructions to Run the Demo](#) or browse the image gallery to discover key functionalities Looking to integrate this approach into your test strategy? [Contact our team](#) to explore how DAS can support your roadmap.

# How to run the

## How to Run the Adaptive Test Demo with an UltraEdge

Reference: RA\_451

This section provides step-by-step instructions to explore the key features of the Adaptive Test DAS Demo by using an UltraEdge.

---

### Step 1: Load the Test Program

Use the SimpleOI interface to load your test program.

## Step 2: Start the DAS

Start the DAS in order to interact with the UltraEdge System

## Step 3: Start the DAS

Be sure that your UltraEdge VM is started. Click on "Deploy Application to the UE"

## Step 4: Execute the Program in Loop Mode

Click the **Loop** button to execute the program 10 times. Once completed, press the **Stop** button.

## Step 5: Visualize the Test executed

In the demo application, click **Update Test Limits**. Use the slider to modify the thresholds, then click **Send Limits** to apply them.

| Icon                                                                                | Description     |
|-------------------------------------------------------------------------------------|-----------------|
|  | Test Start Icon |

| Icon                                                                              | Description                           |
|-----------------------------------------------------------------------------------|---------------------------------------|
|  | Test End Icon                         |
|   | Test Executed                         |
|   | Test Not Executed                     |
|  | Test Disabled by an Adaptive command  |
|   | Limits updated by an Adaptive command |

For each test the following data will be displayed

Test3 - 1021

PASS

5 Yield 80.00 %

4 / 1

| Data | Description | |-----|-----

-----| | Test3 | Represents the test name | | 1021 | Represents the test number | | PASS | The last execution was PASS | | 5 | Number of times the test has been executed | | 80.00% | Yield of this test | | 4 | Number of Pass | | 1 | Number of Failure |

Run the test a few times from the SimpleOI interface to observe the impact.

## Step 6: Observe the New test Activated

Loop the test program till you observe that the new test has been enabled. After few runs you will see that the test UL\_TestF1 has been activated.

As well you can

observe that a new message has been generated

## Adaptive Tests

[Export to Excel](#)

Export to JSON  
Format

And as well a message will be added into the

```
{
  "TIME_STAMP": "2025-05-07T09:06:12.9764125Z",
  "LOT_ID": "UNKNOWNLOT_PID_18776_1",
  "SUBLOT_ID": "UNKNOWNSUBLOT_PID_18776_1",
  "DAS_ID": 3,
  "TESTSTEP_ACTIONS": [],
  "ENABLEWORD_ACTIONS": [
    {
      "ACTION": "ENABLE",
      "REQUEST_ID": 2,

      "LO_LIMIT": -10,
      "HI_LIMIT": 8.1
    },
    "STATUS": "OK"
  }
],
"ENABLEWORD_ACTIONS": []
```

Finally we can observe Adaptive Message are generated

## Step 8: Test Disabled

As soon as the test2 reaches the yield of 80% it will be disabled by an Adaptive test command

## Step 9: Check the STDF File

Stop looping the test program and click and *Datalog Setup* on the SimpleOI

The screenshot shows the 'Datalog Setup' dialog box. The 'Output' section is active, showing options for 'Window', 'Text File', and 'STDF File'. The 'Test Criteria' is set to 'All tests' and 'Output Width' is 0. The 'Report' section shows 'Total Summary (By Test)' selected. The 'Display...' button is visible.
